

AJAX UpdateProgress Tip

Contributed by Steve Gourley

If you are using Microsoft ASP.NET AJAX then you are probably familiar with UpdatePanels. I came across a small hangup when using multiple UpdatePanels and UpdateProgress controls. The way an UpdateProgress control is triggered is whenever an update panel gets updated. So if you have multiple UpdateProgress controls, they all fire unless you set the AssociatedUpdatePanelID to a specific UpdatePanel.

If you set the AssociatedUpdatePanelID in the aspx code it does not work. The work around for this is to set the

`UpdateProgress.AssociatedUpdatePanelID = UpdatePanel1.ID;` in your aspx.cs code. `UpdatePanel1.UniqueID` does not work as well as `ClientID`.

Then all is well.
