This script can be used to display proper case labels in ArcMap. Just open the Layer Properties window, click on Labels and then open the Label Expression window, check advanced and copy and paste the code below into the script window. Right now it is set to work on a field called Label but this can easily be changed.

The script will take a value in the LABEL field like "SILVER SHADOWS DR" and display it as "Silver Shadows Dr"  
Function FindLabel ( [LABEL] )

```
dim txt,a,i, labelStr

txt = [LABEL]

if (not isnull(txt)) then

  if (len(txt) > 0) then

    a=Split(txt)

    for i = 0 to ubound(a)

      if (i = 0) then

        labelStr = labelStr & " " & UCase(left(a(i),1)) & LCase(right(a(i), len(a(i)) -1))

      else

        labelStr = labelStr & " " & UCase(left(a(i),1)) & LCase(right(a(i), len(a(i)) -1))

      end if

    next

  end if

  FindLabel = labelStr

End Function
```
