Last Updated 03, Jun. 2009

Currently, through the GIS Portal, AGRC provides indexing and listing of the data sets in the SGID and linkages to the metadata for individual data sets.

While a variety of web-page based indexes (e.g., "by name", "by category") present static lists of what is available, there is neither a capability to register new data sets, nor to query for available data.

This business plan lays out a plan of action for developing truer "upload" functionality for the SGID that will allow the Utah GIS Community to contribute to the database in a more horizontal, distributed, and expedited manner.
