

ArcGIS Server, AGRC, & SGID Data

Contributed by AGRC Administrator
02, Mar. 2007

AGRC is in the process of developing custom websites that utilize SGID GIS data together with ArcGIS Server. ArcGIS Server technology allows any geoprocessing functionality including feature editing to be conducted from an internet browser client. The user interface for ArcGIS Server websites must be custom programmed and AGRC is primarily using C# .net to do this. Most of the ArcGIS Server Sites will be hosted at <http://mapserv.utah.gov>. Regional facilities and historic structures ArcGIS Server demonstration websites are currently available.
