This page is actively being updated by the AGRC Cadastral Data group, look for more information here in the near future. Cadastral data is data related to formal survey reference systems and in Utah includes:

- the Public Land Survey System (PLSS) townships, sections, section divisions, and corner points;
- public land ownership records including: owning entity, administrative agency, and binding designations
- private land ownership including: subdivisions and parcels
- GPS base station locations

Many cadastral data layers are available for download from the Utah State Geographic Information Database (SGID) including parcel data from 27 of 29 counties.
