AGRC now has statewide color infrared imagery derived from the 2006 NAIP flight. This imagery, although displayed in ArcMap as Red, Green, and Blue (RGB), actually displays the Near Red, Red, and Green bands in the imagery and is useful for discerning features such as vegetation that give off a distinct signature in the infrared spectrum. The CIR imagery is available through the SGID ImageServer (NAIP2006_CIR) and through FTP download as Quarter Quad TIFF files and Mr. Sid county mosaics.
